

ex1

Calculate the probability for each event:

- a) A standard normally distributed variable is larger than 2?

$$\Pr\{N(0,1) \geq 2\} = \int_2^{\infty} \phi(x, \mu=0, \sigma=1) dx = 0,0228$$

- b) A normally distributed variable with mean = 40 and variance equal to 9 is smaller than 34

$$\Pr\{N(40, \sqrt{9}) \leq 34\} = \int_{-\infty}^{34} \phi(x, \mu=40, \sigma=\sqrt{9}) dx = 0,0228$$

- c) Getting 9 successes out of 10 in a binomial trial with $p=0.8$

$$\phi_{\text{binom}}(x, n, p) = \binom{n}{x} p^x (1-p)^{n-x}$$

$$\Pr\{\text{Bin}(x, n=10, p=0.8) = 9\} = \binom{10}{9} 0.8^9 (1-0.8)^1 = 0,268$$

- d) $X > 6.2$ in a χ^2 -distribution with 2 degrees of freedom.

$$\phi_{\chi^2}(x, k) = \frac{1}{2^{k/2} \Gamma(k/2)} x^{k/2-1} e^{-x/2}$$

$$\Pr\{\chi^2(x, 2) > 6.2\} = \int_{6.2}^{\infty} \phi_{\chi^2}(x, 2) dx = 0,045$$
